It's not "just steel"!

The diverse areas of work encountered by MPS blades each require their own range of steel qualities. This guarantees the best possible material performance over long life spans. For this reason, the choice between CV, HSS, Bi-Metal and HM models must be carefully evaluated to achieve the best result.

<p>CV</p>	<p>High-alloyed Chrome Vanadium steel is used for work on softer materials such as wood, fibreboard and synthetic materials.</p>	
<p>HSS</p>	<p>High Speed Steel, hardened in a vacuum furnace, is used for work on harder materials such as metals (iron and steel), aluminium and non-ferrous metals.</p>	
<p>Bi-Metal</p>	<p>Bimetal 65-67 Hrc - the perfect combination of flexibility (due to the spring steel, which despite bending, always returns to its original form) and durability, thanks to the HSS strips manufactured with Cobalt, which are welded on. Bimetals are hardened in a vacuum furnace. Suited to work on woods and metals.</p>	
<p>HM</p>	<p>Carbide, high abrasion resistance = longest life. Carbide HM blades are suitable for all areas of use.</p>

Specific Cutting Techniques for Optimum Cuts

<p>CT</p>	<p>Cross-ground, tapered</p>		<p>The wood grain is cut by the slanted angle of the tooth. CT ground edges don't come in contact with the saw kerf and therefore produce extra-clean cuts.</p>	
<p>CS</p>	<p>Cross-ground, set</p>		<p>The angular-sloped tooth cuts the wood grain. CS- ground teeth give the blade an extra high cutting-speed.</p>	
<p>MS</p>	<p>Milled, alternate set (raker set)</p>		<p>The wood grain is ripped and the saw set moves upwards and downwards in the saw kerf producing a rough cut.</p>	
<p>MS</p>	<p>Milled, wavy set</p>		<p>The cut takes place on the entire surface of the tooth. The only difference is in the tooth formation.</p>	
		<p>Tooth Shape:</p> <ul style="list-style-type: none"> D = Roof Tooth P = Positive Tooth N = Normal Tooth 		
		<p>VARIOZAHN</p>	<p>Variable tooth jig saw blades with alternate tooth spacing, guarantee universal bits for even the most varied materials. The bimetal blade is completely flexible and shatter-resistant.</p>	

Material Quality and Areas of Use

Cutting Geometry	MS Milled, wavy set, straight-set	CS Cross-ground, set	CT Cross-ground, tapered
CV	Standard cuts in wood	Very fast cuts	Very clean cuts
HSS	For metal work

HM	For abrasive materials for work on metals	For abrasive materials for work on woods	

Extreme Curve Cutting

MPS 3182 EURO

The amazing new 3182 blade is capable of extreme curve cutting in all kinds of wood related materials.

The 3182 blade is a high quality, virtually unbreakable, vario-pitch back cutting sawblade – a truly unique jigsaw blade!

Fast Splinter free sawing in all wooden materials up to 40mm thick.

VARIOZAHN

A = 2.2 - 3.2 • 10-14 TPI
B = 95mm • 3³/₄"
C = 115mm • 4¹/₂"

Specialised Curve Cutting

MPS 3101-KR EURO

MPS 3401-KR UNIVERSAL

The specialised 3101-KR blade from MPS is designed for extra clean cutting in laminated wooden fibreboard and plastic.

Fine back cutting teeth ensure the cleanest curved cuts every time - especially suited to benchtop cutouts etc.

Suitable for wood related materials and plastic up to 30mm thick.

A = 2.5 - 3.2 • 10 TPI
B = 75mm • 3"
C = 100mm • 4"

Clean Cutting - Test Winner

MPS 3160 EURO

The 3160 blade shone as the clear winner in recent European jigsaw blade comparison testing between leading brands.

The 3160 is a double cut blade for clean, splinter free sawing of hardwoods, softwoods, coated wooden fibreboard and synthetic materials.

A = 2mm • 12 TPI
B = 75mm • 3"
C = 100mm • 4"

Clean Cutting - Test Winner

MPS 3145 EURO

The 3145 blade is another European test winner from MPS. It is ideal for clean, fast cuts in hardwoods, softwoods, laminated wooden fibreboard, plywood and synthetic materials.

A = 3mm • 8 TPI
B = 75mm • 3"
C = 100mm • 4"

TOOTH SPACING

The tooth spacing "T" is the distance in mm from the point of one tooth to the next. Sometimes the tooth spacing is given in inches.

E.g. 14 teeth/inch correspond to a 1.8mm pitch

$$T = \frac{25.4\text{mm}}{14} = 1.8\text{mm}$$

The class of tooth spacing, which should be used in practice is dependant upon:

- a> The thickness of the material. Tooth spacing should be chosen so as to ensure that at least 3 teeth are always in the material at the same time. E.g. 6mm thick material - 2mm tooth spacing for boards with thinner supports.
- b> The strength of the material.

A generally applicable rule is: the harder the material the smaller the tooth.
